频率最低点公式推导

$$\left| \Delta f(t_{tra}) \right| = \begin{cases} \frac{\Delta P_{Max}^{\mathcal{D}}}{D_t'} \cdot (1 - e^{\frac{D_t'}{2H_t^{Sys}} \cdot t_{tra}}) & \text{if } t_{tra} \in [t, t_{DB}) \\ \Delta f_{DB} + (\frac{\Delta P_t'^{\mathcal{D}}}{D_t'} + \frac{2H_t^{Sys} \cdot PFR_t'}{D_t'^2}) \cdot (1 - e^{\frac{-D_t'}{2H_t^{Sys}} \cdot (t_{tra} - t_{DB})}) - \frac{PFR_t'}{D_t'} \cdot t_{tra} - t_{DB} , & \text{if } t_{tra} \in [t_{DB}, t_c) \end{cases}$$

$$\Delta f_c + (\frac{\Delta P_t''^{\mathcal{D}}}{D_t'} + \frac{2H_t^{Sys} \cdot PFR_t''}{D_t'^2}) \cdot (1 - e^{\frac{-D_t'}{2H_t^{Sys}} \cdot (t_{tra} - t_c)}) - \frac{PFR_t''}{D_t'} \cdot \left(t_{tra} - t_c \right) & \text{if } t_{tra} \in [t_c, t_g) \end{cases}$$

式中: $\Delta P_{t}^{\prime\mathcal{D}} = \Delta P_{Max}^{\mathcal{D}} - D_{t}^{\prime} \cdot \Delta f_{DB}$; $\Delta P_{t}^{\prime\prime\mathcal{D}} = \Delta P_{Max}^{\mathcal{D}} - (\sum_{g} PFR_{g,t}^{\mathcal{G}}(\boldsymbol{\xi}^{t}) + \sum_{w} PFR_{w,t}^{\mathcal{W}}(\boldsymbol{\xi}^{t})) \cdot T_{c} / T_{g}$ $-\sum_{c} PFR_{c,t}^{\mathcal{PB}}(\boldsymbol{\xi}^{t}) - D_{t}^{\prime} \cdot \Delta f_{c}; \quad PFR_{t}^{\prime\prime} = (\sum_{g} PFR_{g,t}^{\mathcal{G}}(\boldsymbol{\xi}^{t}) + \sum_{w} PFR_{w,t}^{\mathcal{W}}(\boldsymbol{\xi}^{t})) / T_{g} + \sum_{c} PFR_{c,t}^{\mathcal{PB}}(\boldsymbol{\xi}^{t}) / T_{c}$ $PFR'' = (\sum_{g} PFR_{g,t}^{\mathcal{G}}(\boldsymbol{\xi}^{t}) + \sum_{w} PFR_{w,t}^{\mathcal{W}}(\boldsymbol{\xi}^{t})) / T_{g} \circ$

当 $\partial |\Delta f(t_{tra})|/\partial t=0$ 时,可得:

$$t' = \begin{cases} t_{DB} - \frac{2H_t^{Sys}}{D_t'} \cdot \log(\frac{2\kappa'}{\Delta P_t'^{D} \cdot D_t' + 2\kappa'}) \\ t_c - \frac{2H_t^{Sys}}{D_t'} \cdot \log(\frac{2\kappa''}{\Delta P_t'^{D} \cdot D_t' + 2\kappa''}) \end{cases}$$

$$\Rightarrow \begin{cases} 2\kappa_t' \cdot \log(\frac{2\kappa'}{\Delta P_t'^{D} \cdot D_t' + 2\kappa'}) \leq D_t'^2 \cdot (\Delta f_{max} - \Delta f_{DB}) - D_t' \cdot \Delta P_t'^{\mathcal{L}} \text{ if } t_{tra} \in [t_{DB}, t_c) \\ 2\kappa_t'' \cdot \log(\frac{2\kappa''}{\Delta P_t'^{D} \cdot D_t' + 2\kappa''}) \leq D_t'^2 \cdot (\Delta f_{max} - \Delta f_c) - D_t' \cdot \Delta P_t''^{\mathcal{L}} \text{ if } t_{tra} \in [t_c, t_g) \end{cases}$$

$$\stackrel{\text{d. 1.}}{\Rightarrow} \left\{ 2\kappa_t'' \cdot \log(\frac{2\kappa''}{\Delta P_t'^{D} \cdot D_t' + 2\kappa''}) \leq D_t'^2 \cdot (\Delta f_{max} - \Delta f_c) - D_t' \cdot \Delta P_t''^{\mathcal{L}} \text{ if } t_{tra} \in [t_c, t_g) \right\}$$

将(A-2)带入(A-1),可得:

$$|\Delta f_{nadir}| = \begin{cases} \Delta f_{DB} + \frac{\Delta P_t^{\mathcal{L}'}}{D'} + \frac{2\kappa'}{T_c \cdot D_t'^2} \\ \cdot \log(\frac{2\kappa'}{T_c \cdot \Delta P_t^{\mathcal{L}'} \cdot D_t' + 2\kappa'}) & \text{if } t_{tra} \in [t_{DB}, t_c) \\ \Delta f_c + \frac{\Delta P_t^{\mathcal{L}''}}{D'} + \frac{2\kappa''}{T_g \cdot D_t'^2} \\ \cdot \log(\frac{2\kappa''}{T_g \cdot \Delta P_t^{\mathcal{L}''} \cdot D_t' + 2\kappa''}) & \text{if } t_{tra} \in [t_c, t_g) \end{cases}$$

$$(A-3)$$
